1 LOS ANGELES, CALIFORNIA; MONDAY, FEBRUARY 29, 2016

2 10:15 A.M.

3 - - -

4 THE CLERK: Calling Item Number 1, CV 15-6024-AB,  
5 Groundswell Technologies, Inc. versus Synapsense  
6 Corporation, et al. Counsel, please state your appearances.

7 MR. NI: Thank you. For the plaintiff, Hao Ni,  
8 and with me is my co-counsel, Kris LeFan.

9 THE COURT: I couldn't hear you.

10 MR. NI: No problem, Your Honor. My name is  
11 Hao Ni, and with me is my co-counsel, Kris LeFan.

12 THE COURT: Good morning.

13 MR. HAWKINS: Good morning, Your Honor, I am  
14 Brent Hawkins on behalf of the defendants, Synapsense  
15 Corporation.

16 THE COURT: We are here on a Motion to Dismiss on  
17 a very interesting case Defendants' Motion to Dismiss for  
18 lack of a patentable subject matter.

19 I did not issue a tentative in this case for a  
20 number of reasons. I wanted to hear from the parties, hear  
21 the argument from the parties on this.

22 I guess I would ask plaintiff's counsel, Mr. Ni, I  
23 believe you had attempted to file a sur-reply, but it was  
24 stricken. I'm curious was what the reason for filing the  
25 sur-reply. That's a little unusual. So I was just curious.

1 MR. NI: That's correct, Your Honor. We just  
2 wanted to address some additional points that were in  
3 defendants' reply brief, and we thought, you know, we didn't  
4 get the opportunity to do so. It was raised in --  
5 Your Honor, we thought it was raised in the reply brief; so  
6 we wanted to have a chance to address that in the sur-reply.

7 THE COURT: Okay. Well, then, I am assuming you  
8 you will have an opportunity to do that here today.

9 MR. NI: Yes, Your Honor.

10 THE COURT: All right. So I understand from our  
11 courtroom deputy that I believe the plaintiff has a  
12 PowerPoint they want to present?

13 MR. NI: Yes, Your Honor. We have -- well, rather  
14 than doing it on the screen, we have physical copies that we  
15 can provide you one and one for the clerk and then one for  
16 the defendant as well.

17 THE COURT: And have you provided a copy of that  
18 to defense counsel this morning at least?

19 MR. NI: No, we have not.

20 THE COURT: So they have not seen it?

21 MR. NI: They have not seen it.

22 THE COURT: Mr. Hawkins, I am assuming you have  
23 something to say about this PowerPoint.

24 MR. HAWKINS: I object, but I will let them go  
25 ahead and use it. I don't know that it will affect the

1 argument.

2 THE COURT: Okay. Why don't you present it to the  
3 courtroom deputy and make sure defense counsel -- but going  
4 forward, Mr. Ni, if you have got an exhibit that you intend  
5 to use, it probably makes sense to let defense counsel have  
6 it in advance.

7 MR. HAWKINS: Actually, Your Honor, it's fairly  
8 extensive. Is there a way -- and I don't want to disrupt  
9 the Court's schedule -- but if we could be called second to  
10 give me an opportunity just to look through it? It doesn't  
11 look particularly problematic, but I would like to just take  
12 a look.

13 THE COURT: You know, in fairness, I did note it  
14 is pretty voluminous. The PowerPoint is about 25 pages.

15 Do we have the parties here on our second matter?  
16 Looks that way. So why don't we do that. That's a good  
17 suggestion, have you -- have an opportunity to do that.  
18 We'll deal with our second matter right now, and then we'll  
19 call this one back momentarily.

20 MR. NI: Thank you, Your Honor.

21 (Recess taken 10:19 to 10:40 A.M.)

22 THE CLERK: Calling -- recalling calendar  
23 Item Number 1, CV 15-06024-AB, Groundswell Technologies,  
24 Inc., versus Synapsense Corporation, et al.

25 THE COURT: All right. Thank you. So you have

1 had a few minutes at least. I don't expect or -- that you  
2 would have time to absorb every single page of this, but,  
3 Mr. Hawkins, do you feel that you are in a better position  
4 to proceed going forward, and do you wish to make any  
5 objections with respect to the PowerPoint?

6 MR. HAWKINS: I do wish to make an objection,  
7 Your Honor. But as to the content, we hadn't had a chance  
8 to fully vet it, but I do feel that I am in a position to  
9 proceed.

10 THE COURT: Your objection is noted for the  
11 record. I can consider this for purposes of the oral  
12 argument, and I will do so for that purpose only. It's not  
13 an exhibit to any of the motions, but I will allow Mr. Ni to  
14 proceed.

15 And I appreciate the fact that you prepared this  
16 PowerPoint because the -- one of the first questions I was  
17 going to ask is just provide for me in layman's terms the  
18 description of the technology at issue.

19 Obviously, it's referred to in the papers. There  
20 is an attachment of the actual patent, but I'd appreciate,  
21 sort of, a layman's sense of what is this technology because  
22 ultimately the issue is, I think, is it any different than  
23 anything that's already out there? And so but please  
24 proceed.

25 MR. NI: Thank you, Your Honor. Just for the

1 record, the PowerPoint was not meant as evidence. It's more  
2 a demonstrative for explaining the discussion today.

3 THE COURT: Fair point.

4 MR. NI: Your Honor, I guess, since this is  
5 actually defendants' Motion to Dismiss, I believe defendant  
6 should actually begin their discussion on why they believe  
7 this patent is invalid as the patent is given a presumption  
8 of validity.

9 THE COURT: We can do that, but while you're here  
10 I would like to hear you from first only because I just want  
11 to understand what this technology -- I would think that you  
12 would be in the best position to explain that.

13 MR. NI: Sure. Not a problem, Your Honor. So I  
14 will begin with just a little bit of background about the  
15 patent.

16 So the patent, the inventors of the patent,  
17 Dr. Mark Kram, is a -- was a professor at UC Santa Barbara  
18 here, and his co-inventors worked with him at this company  
19 referred to as Groundswell Technologies. And Groundswell  
20 made software which operated with these environmental  
21 sensors to show sort of a visualization of what the sensors  
22 are detecting because the sensors collect massive amounts of  
23 data.

24 So for someone like you and me to figure out what  
25 the sensors are actually collecting, you need a good way to

1 visualize it over a 3D topography to see, well, here are  
2 sensitive areas. These areas we need to be cautioned of  
3 because there is certain rises in temperature at this point  
4 or there is overflow of water at this point.

5 So those sensors and all the data they collect are  
6 then sent to these computer systems, and there is a very  
7 specific way the patent describes on how to process that  
8 data and then how to return a visualization of all of that  
9 data you are looking at.

10 THE COURT: How is that different than other  
11 geographical information systems and their technology?

12 MR. NI: That's set forth in the claims here. So  
13 there is a lot of discussion in the briefing where the  
14 defendants group all the claims together. They say the  
15 concept is the same in all claims. When I am addressing  
16 these, I will address them as the system claims and the  
17 method claims.

18 So Claims 1 through 8 are all system claims, and  
19 then Claims 9 through the remainder, 9 through 20, are all  
20 method claims. There is different standard in viewing some  
21 of these claims.

22 So with respect to the system claims, each single  
23 claim has a number of means-plus-function elements. Now,  
24 those claims by themselves need to be construed by the  
25 Court.

1           If you look at one of the cases that --

2           THE COURT: Mr. Ni, do me a favor. Slow down a  
3 little bit. I know there is a lot of information here, and  
4 I want to make sure we get this all down.

5           MR. NI: My apologies. I do tend to talk a bit  
6 fast, and this patent case is probably not as interesting as  
7 the first case we had in front of us.

8           THE COURT: I disagree. I found this very  
9 fascinating, over the last week, and I was excited to hear  
10 from experienced litigators as to what this is all about.  
11 So I welcome the discussion.

12           MR. NI: Okay. Well, in this Court, in the  
13 Nomadix versus Hospitality Core Services, case CV 14-08256,  
14 in that case the defendants brought a Motion to Dismiss  
15 patent on the same grounds.

16           The Court denied it because they found it was  
17 premature in view of the fact that none of the terms in the  
18 patent had been construed.

19           So even if there was a supposed valid reason for  
20 this motion here, in this case, the systems claims all have  
21 these means-plus-function limitations which should be  
22 construed by this Court first. Because once we get a claim  
23 construction on the means-plus-function limitations, then  
24 the Court will realize that all of the elements in the  
25 system claims are not just generic computers and sensors as

1 the defendants are claiming.

2 The patent specifically provides what the  
3 structures are for the means-plus-function claims, and these  
4 are not generic structures. They're specific hardware and  
5 software structures. The patent goes into a lot of detail  
6 on some of this stuff --

7 THE COURT: Are you saying that the these, I  
8 guess -- well, I guess the question I have is that the means  
9 and function -- means plus function, are you saying that  
10 sets it apart from other GIS technology?

11 MR. NI: Well, the means plus function, when you  
12 construe it, you construe a means term, as you know, that by  
13 the corresponding structure and the function of the  
14 means-plus-function term. So you have to look at the patent  
15 to see what the corresponding structure is, and then the  
16 patent discloses a number of specific examples on the -- on  
17 these, basically, explicit hardware and software structures  
18 and algorithms that perform these functions.

19 What that does is it's not, basically, an abstract  
20 concept of doing something. The patent is providing  
21 specific embodiment and specific structures on how these  
22 means -- the system claims should be described.

23 THE COURT: All right. Please continue.

24 MR. NI: And one of the things that defendants say  
25 about all of these claims is that it's directed to an

1 abstract concept. So in the slides and in the briefing, we  
2 mention that they named a number of different abstract  
3 concepts. They've -- if you go to, I think, Slide -- I want  
4 to say -- it is Slide 16 and 17.

5 THE COURT: Okay. I see it.

6 MR. NI: Right. So in their original motion, the  
7 defendants said that the invention in this patent is  
8 directed to the abstract concept of monitoring data, is  
9 directed to the concept of detecting data, directed to the  
10 concept of reporting and displaying data. It's directed to  
11 the abstract concept of interpolating the data, and it's  
12 directed to the abstract concept of gathering and organizing  
13 data from multiple locations. It's directed to the abstract  
14 concept of plotting data on a map and directed to the  
15 abstract concept of tracking trends based on compiled data.

16 While it's true that the mention actually is  
17 directed to a lot of different concepts, it's -- provides a  
18 very specific implementation of how to get there. It's not  
19 just saying, "Hey, this claim is about monitoring data."  
20 It's not preempting entire field of monitoring data. It's  
21 saying these are very specific ways of monitoring data.

22 There are certain functions that have to be  
23 performed, certain ways the data has to be processed, and  
24 certain outcome visualizing the data.

25 If you were to --

1 THE COURT: I'm sorry. As it relates to that, I'm  
2 just trying to figure out -- is it your contention that this  
3 technology monitors data in a different way than others  
4 would monitor data?

5 MR. NI: This invention is not directed to just  
6 monitoring data. It's directed to, basically, monitoring  
7 environmental parameters using these sensors. These sensors  
8 have a telemetry system which then sends it to a computer  
9 having specific software modules set to process this data.

10 Now, those software modules require -- they're  
11 very specific requirements. They have to take that data,  
12 put it into a cardinal matrix format, and then that format  
13 is then used to create a cartographic layout, which is sort  
14 of a visualization of that data using a few number of steps  
15 it takes.

16 It has to do a geostatistical analysis. In the  
17 example in the patent, when you actually collect the data  
18 and put in the cardinal matrix, you have all these different  
19 points. You have the XYZ coordinates. You basically also  
20 have a column for the time and all of --

21 THE COURT: Let me stop you there for a second. I  
22 want to give the reporter a chance to catch up.

23 MR. NI: Sorry.

24 THE COURT: But I guess I go back to the question.  
25 This technology is about monitoring environmental

1 parameters, if I understood you correctly. Are you  
2 suggesting, or is it your contention that this technology  
3 monitors environmental parameters in a different way than  
4 other technology?

5 MR. NI: That's correct, Your Honor, it does.

6 THE COURT: That's because of all the -- I'm just  
7 looking through -- the differences in this cardinal matrix  
8 format and things of that nature that make this different?

9 MR. NI: Yes. There are a number of limitations  
10 in the claims that make it a very specific limitation of  
11 monitoring. It's not just monitoring data. It's monitoring  
12 a data using these exact components in the system or  
13 monitoring data using these exact method steps. So it's not  
14 just simply monitoring data.

15 THE COURT: I understand that, but I am just  
16 trying to look at it from the 30,000-foot level. What does  
17 this technology do?

18 MR. NI: Okay. That's fair, Your Honor. The only  
19 reason I wanted to be more specific on that was that's sort  
20 of how someone gets the -- this argument -- abstract idea.  
21 If you look at any technology from a 30,000-foot view, you  
22 can break it all down to abstract idea.

23 If I invented, for example, like, a jet engine, I  
24 could break that down to an abstract idea. I would say it's  
25 an idea of propelling stuff using wind power, propelling

1 stuff using -- creating a force from that, and then you can  
2 break it all down. If you really did that and you can break  
3 every single thing down to abstract ideas, then nothing  
4 would be patentable.

5 THE COURT: Fair enough.

6 MR. NI: That's sort of the distinction there.

7 And the best way to really look at Claim 1 is --  
8 if we could go to Slide 7. And it's just -- all it is is,  
9 sort of, the physical components required in the system  
10 claims.

11 THE COURT: All right. I am at Slide 7.

12 MR. NI: Thank you, Your Honor. So Slide 7 -- the  
13 first claim element is a plurality of sensor packages. This  
14 is a figure -- I believe it's Figure 1 from the patent. It  
15 has these field sensors.

16 And then the next page refers to a means for  
17 transmitting data from the sensor packages and means for  
18 receiving the transmitted data.

19 In the figure here, you have this telemetry  
20 system, and that's also what's described in the patent as  
21 well. So data is then transmitted from the field sensors to  
22 the receiver of the telemetry system.

23 The next slide, Slide 9, is -- refers to the GIS  
24 integrated command structure, which is the computer-looking  
25 thing on the right corner.

1 And on the left side, it's the specific software  
2 modules that's used to -- used by that system to process all  
3 that data and to result in the visualization we're trying to  
4 get there at the end of the claim.

5 I could walk you through all the different  
6 elements here.

7 (Reading:) First element is a means for  
8 manipulating data connected to receiving  
9 means. Said manipulating means providing real  
10 time data formatted into a cardinal matrix  
11 form corresponding to a simultaneous,  
12 automated monitoring event for the sensor  
13 packages.

14 As you see here in Figure 3, an example of that is  
15 34 -- and I think the printing may make it hard to read --  
16 but it talks about how the data is then placed into this  
17 matrix format with these different corresponding  
18 coordinates, the XYZ, what's received from each sensor, and  
19 the time value of when that data is received.

20 THE COURT: Okay. I think I am getting sort of  
21 the gist of your point.

22 I don't think there is necessarily a need to go  
23 through each one, but your point is simply how this -- how  
24 the technology provides -- these environmental parameters  
25 are set forth in these individual, distinct algorithms and

1 calculations that sets it apart from just the abstract idea  
2 concept that makes this unique to this patent.

3 MR. NI: Right. And that's correct, Your Honor,  
4 with respect to the -- to the system claims. So it's a  
5 little bit easier for me to explain the system claims  
6 segments to you because we can look at these physical  
7 components that are -- and software components that are  
8 described in the patent.

9 One of the things that defendants will argue is --  
10 they have tried to bundle the system method claims together.  
11 I would submit to you that realistically the method claims,  
12 because they don't have the same physical structures  
13 attached to them, they have a better argument on their end  
14 whether or not that falls into an abstract concept. We're  
15 willing to concede that point.

16 But then, if you could -- even if they were  
17 considered an abstract concept here, then there is a test  
18 under the Supreme Court Allison Mayo cases. So there's the  
19 two-step test here.

20 Even if we assume that the method claims somehow  
21 falls into one of the abstract concepts or a collection of  
22 the abstract concepts, then we have to look at the inventive  
23 steps in the method claims and then whether or not what's  
24 being claimed preempts the field there.

25 The method steps are similar to the system claims

1 except they're not claiming the software modules and the  
2 physical components that the systems claims claim. So they  
3 still have the specific steps of manipulating the data into  
4 the cardinal matrix format corresponding to a simultaneous  
5 automated monitoring event.

6 THE COURT: You have to step back a number of  
7 sentences because the last thing I show is "so they still  
8 have specific steps of manipulating the data into the  
9 cardinal matrix format corresponding to a simultaneous" --  
10 and then it trails off.

11 MR. NI: Okay.

12 THE COURT: Slow down, please.

13 MR. NI: I apologize, Your Honor. I think it is  
14 the technical words here and the fact that I do tend to talk  
15 fast.

16 The last thing we were talking about was the  
17 method claims also contain these inventive steps. And the  
18 inventive steps include manipulating the data received from  
19 the sensors into a cardinal matrix format corresponding to a  
20 simultaneous automated monitoring event for the sensor  
21 packages.

22 Then the next step triggers the processing of the  
23 matrix formatted data. And then you have to conduct a real  
24 time geostatistical analysis on the matrix formatted data.

25 Using that new formatted data, then GIS, which is

1 Geographical Information System, compatible data is then  
2 created. And finally that data is then used to create a  
3 cartographic layout, which is basically a rendering of a  
4 mapping of where this information is being displayed and  
5 what you can see there. So you create that geo --  
6 cartographic data from all this after performing all these  
7 steps.

8 THE COURT: Counsel, let me interrupt you again,  
9 if I could.

10 I guess I -- the novice in me says, okay. Isn't  
11 this, basically, data plotting? And if so, isn't this  
12 patent we're talking about here just a method of organizing  
13 natural activity in the same way that hedging was in the  
14 Bilski case? I think in that case was the method of  
15 organizing human activity. How is this different?

16 MR. NI: If you look at the method claim and if we  
17 are to concede that it is an abstract concept -- and we are  
18 looking for the inventive element here -- it's not simply  
19 data plotting. It's a very specific and novel way of taking  
20 a bunch of data -- and you are basically getting a data dump  
21 from all these sensors -- and then taking that data and  
22 organizing it, using these specific processes to get to a  
23 manageable visual format.

24 Now, you could take -- I could take sensor data  
25 and plot it; right? But then you run into the problem of

1 dealing with huge amounts of data and not being able to see  
2 a 3D visualization of it or to -- like, basically, I guess  
3 the proper way to do it is, we refer to it as real time  
4 here. So you want to be able to process this data into a  
5 format at certain intervals.

6 Real time doesn't mean it has to be every second.  
7 It's every five minutes or every ten minutes just to give  
8 you the visualization of what's currently happening out  
9 there in the environment.

10 So this patent allows someone to take all that  
11 data and then manipulate it, organize it, using these  
12 specific steps.

13 And if you want to call it "plotting," you are  
14 creating a visualization of all of that data using the  
15 steps. But it's not merely plotting the data as you have to  
16 use these steps to do it. Whereas, I could plot the data  
17 just by taking the data and then putting it onto a map.  
18 That's not what I am doing here.

19 I would have to actually go through these steps of  
20 organizing the data to make it more manageable and more  
21 usable for someone creating these visualizations.

22 THE COURT: I am still kind of confused because  
23 you are saying you make it more manageable and you provide a  
24 visualization. The first question is does the data point  
25 plotting not provide visualization?

1 MR. NI: One of the key differences in this patent  
2 and is talked quite a bit about in the specification and  
3 also defined in some of the dependent claims a little bit  
4 more is this is also -- adds the component of interpolation  
5 as well.

6 You are taking the data. And during the  
7 processing of this data, you are creating additional values  
8 that you would not get normally from the data.

9 So rather than just seeing spots everywhere, like,  
10 where the data is collected, the claims, for example -- let  
11 me see. The best one to look at here would be -- one of  
12 them is Claim 17. It provides a specific example of using  
13 kriging to generate the inferred surface. Kriging is  
14 spelled k-r-i-g-i-n-g.

15 So this is inherent in Claim 9 as well, the way in  
16 which you are doing to the data. Kriging is a process where  
17 you -- there is certain data points you don't know. You  
18 can't have the sensors everywhere.

19 So it's a method of creating interpolation over  
20 the entire space. So say I have data points about five feet  
21 apart. I don't know exactly what the data is between points  
22 1 and 2, but the kriging gives me the ability to use a  
23 formulization to interpolate what that value should be at  
24 those points.

25 THE COURT: You are saying that is something new

1 and unique to this invention? Because I guess ultimately if  
2 this is not an abstract idea, what is the concrete tangible  
3 new invention that your patent contains?

4 MR. NI: I guess it's hard to put into just one  
5 example. It's a combination of all the elements of how you  
6 are processing it. Putting it into the cardinal matrix  
7 format, performing geostatistical analysis on that matrix  
8 information, and then creating a cartographic layout, which  
9 in this case includes interpolating the data to create these  
10 extra visualizations, and then you are overlaying these  
11 visualizations on top of each other or on top of a map or  
12 something that you look at so you have a view of all the  
13 different parameters at different time points.

14 THE COURT: All right. Okay. Another question I  
15 have -- again, I want to try to make sure we cover as much  
16 as possible.

17 How is your technology in this case more of a  
18 concrete invention than the computer program in Alice?

19 MR. NI: The bigger program in Alice was basically  
20 just moving numbers around to create that hedging process.  
21 It wasn't a specific formulization of taking one type of  
22 data and then converting it into a visualization of that  
23 data or creating additional data from that.

24 So one of the cases that defendants cited  
25 numerous in their brief and they tried to analogize this

1 case to it is the Electronic -- Electric Power Group case.  
2 And so in that case, the claims were directed to a method of  
3 detecting events on an interconnected electrical power grid  
4 in real time over a wide area and then automatically  
5 analyzing the events.

6 So all of the claimed elements in the Electric  
7 Power Case dealt with receiving different types of data. So  
8 those claims didn't add anything new. Those claims said,  
9 "We receive a plurality data streams. We receive data from  
10 other power sources. We receive data from nongrid data  
11 sources, and then we display a visualization of those."

12 But they don't give step-by-step on how to  
13 actually take those data and then remanipulate it and create  
14 new information from it and put it into a way that is  
15 manageable and usable for someone versus the amount of data  
16 that you would normally have in your environmental systems.

17 THE COURT: Okay. Let me ask you next. Can you  
18 perform your patented claims on a generic computer or --  
19 that's the question.

20 MR. NI: It would have to be a computer with the  
21 specific software set out in the patent. The patent  
22 describes; certain implementations of how to do -- how to  
23 perform the -- how to create the cardinal matrix, how to do  
24 the geostatistical analysis, how to do the Kriging process  
25 for interpolating the data. A generic machine wouldn't have

1 that. You would actually have to have specific software  
2 modules programmed to do that.

3 THE COURT: Does the patent claims use generic  
4 computer functions then or not?

5 MR. NI: You can use a processor that's programmed  
6 with those functions to do it. So to say --

7 THE COURT: I'm sorry. I didn't -- you said you  
8 can use a processor with the programs?

9 MR. NI: If you have the software programs, you  
10 can use a computer, any kind of computer, to do it as long  
11 as those computer has the programming required to do it.

12 But it also has to operate with sensor packages  
13 with a telemetry system as well. You are adding additional  
14 limitations on that.

15 I know in the defense briefing they argue that is  
16 generic as well. But to that point, then, you could argue  
17 any sort of machine is generic.

18 In one of the cases that we had cited -- I believe  
19 it was the Timeplay versus Audience Entertainment case in  
20 front of this Court as well. That's CV-1505202. The  
21 invention there was a multiplayer video game system where  
22 you have a controller and you have a second display on the  
23 controller, and the second display on the controller also  
24 downloads a game component from the video game server for  
25 playing.

1 Now, you could break that down to saying, well,  
2 it's a generic controller, and it's generic display on that.  
3 But like I said, just like with the abstract concepts, you  
4 can break down any sort of components into generic  
5 components at some point.

6 THE COURT: Okay. I will allow you to continue,  
7 but those are the questions that I had right now.

8 MR. NI: Thank you, Your Honor.

9 And I think that's really most of what I have to  
10 say on the method claims other than the fact that it doesn't  
11 preempt any of the abstract concepts alleged by the  
12 defendants or a combination of them.

13 It doesn't preempt an entire field of monitoring,  
14 electrical environmental parameters. It doesn't preempt  
15 entire field of processing that data.

16 It provides one very specific way of doing  
17 something and getting a result that solves a problem that we  
18 had with large amounts of data normally collected from  
19 environmental systems and managing it in a real time or by  
20 interval-type basis.

21 THE COURT: Thank you, Counsel.

22 MR. NI: Thank you, Your Honor.

23 THE COURT: Mr. Hawkins, you heard a lot here.  
24 Mr. Ni has done a very good job of sort of laying out, look.  
25 This is not just data plotting. It's a lot of internal

1 processes to manipulate and create algorithms to provide  
2 visualization, et cetera. What's your response?

3 MR. HAWKINS: I think Mr. Ni has articulated, but  
4 he still has only articulated generic multifunctional  
5 computers that can manipulate the data and have been used to  
6 manipulate the data over time.

7 There is nothing new about the idea of taking  
8 coordinate data, putting it in a matrix, and then charting  
9 it. People did it by hand prior to software being invented.

10 THE COURT: But I think Mr. Ni had said, for  
11 example, plot -- if you are doing this data plotting, if I  
12 understood him correctly, you have points or sensors at  
13 Point 1, Point 2, Point 3. And it's interpreting the data  
14 in between Point 1 and point 2 that I think sets -- at least  
15 I think he is saying sets his technology apart.

16 MR. HAWKINS: Your Honor, I think the idea of  
17 statistical analysis to interpolate that is also not new or  
18 inventive and shouldn't be protected in patent eligible  
19 subject matter. People -- the EPA has required that this  
20 data be collected for years by people running sites and  
21 other -- in other locations where there might be  
22 geostatistical implications.

23 They have collected the data through sensors.  
24 That's nothing new. They they have taken that data and  
25 interpolated it by using statistical analysis, and they

1 plotted it to maps.

2 THE COURT: But they indicate that they utilize  
3 special systems to provide this visualization. Are you  
4 saying that that's nothing new?

5 MR. HAWKINS: It's important first to look at the  
6 claims when doing the analysis and not to the specification,  
7 and I submit that neither provide anything new.

8 The claims themselves are not so limited. We  
9 could start with the method claims. They're not so limited  
10 themselves to any particular version of the software or any  
11 specialized software.

12 And even if you look for -- look to the apparatus  
13 or system claims, the means for functionality, and you look  
14 to the actual structure disclosed, you will see that there  
15 is nothing new about those kind of systems.

16 I think plaintiff will concede that that kind of  
17 software functionality is available. But putting it  
18 together in a package for real time analysis is really what  
19 their claims are directed to, and that's simply not enough  
20 to make a patent eligible subject matter.

21 THE COURT: What basic tools of invention is the  
22 plaintiff's patent monopolizing, in your view?

23 MR. HAWKINS: Gathering -- we can start with the  
24 narrower -- gathering geostatistical data, analyzing it, and  
25 plotting it. And as we -- we tried -- I know the plaintiff

1 made much ado about use of different words that we think are  
2 kind of synonymous, but it is.

3 It is monitoring and/or gathering the data,  
4 analyzing the data, using statistical analysis, and then  
5 displaying it on a -- over a map. In this case, the map is  
6 generated via computer.

7 THE COURT: What basic tools are you unable to use  
8 without infringing on the patent?

9 MR. HAWKINS: Well, we would say a lot, but, I  
10 mean, the idea of collecting information in a software that  
11 processes geostatistical data by plotting it into  
12 coordinates and then generating a resultant map we think  
13 would be preempted.

14 And broadly, Your Honor, and as applied here,  
15 we're actually not -- this case is not from our standpoint  
16 about even geostatistical data.

17 Our client makes -- has data rooms with computer  
18 shelves, computer stacks, and monitors heat -- heat in the  
19 data room. So it's broadly, as at least as plaintiff is  
20 applying it here in this case, it preempts even -- an even  
21 broader field, or at least they contended it does by  
22 asserting allegations of infringement against our client's  
23 product and systems.

24 THE COURT: These are questions that I have come  
25 up with. I just want to make sure I cover all of them

1 before we take it under submission.

2 Are there any aspects of your technology that have  
3 no possibility of infringing on the plaintiff's technology?

4 MR. HAWKINS: Well, Your Honor, I think if you  
5 look at the specific means-plus-function analysis -- so if  
6 you input -- the analysis goes this way: It has to be the  
7 exact function and you look at the structure that's  
8 disclosed, the specific structure that's disclosed, or its  
9 equivalent, and if you look at the way we plot in a matrix,  
10 we don't do that. We don't do it the same way.

11 Doesn't mean what they're saying isn't broad  
12 enough to encompass the generic taking of information and  
13 plotting it, but it certainly limits the field to a specific  
14 one if indeed you interpret the means for a plus function as  
15 we would have you interpret it. So it depends on ultimately  
16 that.

17 But broadly speaking, taking information and  
18 plotting it into a specific -- plotting it and taking that  
19 and extrapolating it to statistical analysis is nothing new.

20 THE COURT: From your perspective, should the  
21 Court give any deference to the fact that the Patent  
22 Trademark Office issued a patent to the plaintiff for the  
23 technology?

24 MR. HAWKINS: I think the Court needs to give the  
25 deference of it's presumed valid. It certainly doesn't mean

1 that patents can't be invalidated.

2 And I don't like to point to other cases, but  
3 there are -- there have been a particular slew of patents in  
4 this particular time frame, for whatever reason, that have  
5 deemed to be -- and I think it's partially at evolution of  
6 the law -- deemed to be unpatentable or nonpatentable,  
7 patent eligible subject matter as a result of an evolution  
8 of the law.

9 So, yes, I think there should be deference given  
10 to the patent office, under the law it should be presumed to  
11 be valid or not invalid, but it doesn't mean, under  
12 appropriate circumstances as we have here, the claim  
13 shouldn't be invalidated.

14 THE COURT: Is it your contention that these two  
15 systems are not different at all, they're one and the same  
16 from your perspective? The systems we're talking about  
17 here, are they innately different in your mind?

18 MR. HAWKINS: The broad -- the abstract system and  
19 what's here?

20 THE COURT: Yes.

21 MR. HAWKINS: No, I do not think so.

22 THE COURT: All right. Let me see.

23 I think those are all the questions that I had for  
24 you, Counsel.

25 Mr. Ni, you appear eager to get back to the

1 lectern; so I will allow you an opportunity to be heard.

2 MR. NI: Thank you, Your Honor. I just wanted to  
3 make a few quick points.

4 Defendants concede that, on the system claims,  
5 they do have to be construed according to the corresponding  
6 structure and their exact function.

7 So when this Court looks at the different sets of  
8 claims, the system claim and the method claims, you should  
9 look at that with a distinction there, that those claims do  
10 have a specific structure that's being described in the  
11 patent.

12 Now, defendants say that all the claims are the  
13 same and they all preempt the field. But they also make the  
14 argument that their own system does not. So we can't be  
15 preempting the field and then they have a product that's in  
16 the same field that, therefore, doesn't infringe.

17 That makes very little sense to me in that sense  
18 because you have to say, well, this field is so narrow that  
19 you are preempting that we don't infringe.

20 But that's what patent law is. You get a monopoly  
21 on a specific invention, and that invention may be a very,  
22 very narrow field. That doesn't go anything against what  
23 these patents should be allowed for.

24 They also talk about their products as, you know,  
25 heat maps on -- in server farms. There is really no

1 distinction in this case here in the claims.

2 The claims talk about gathering environmental  
3 data. Collecting heat sensors in a server farm is also  
4 collecting environmental data. That's really not a point  
5 for this discussion. I just kind of felt like making that  
6 point there.

7 And, you know, I think defendants' other point on  
8 the patents are presumed valid is correct for pretty much  
9 this patent and other patents. And in this case -- I know  
10 this is not entirely relevant and we mentioned it briefly in  
11 our briefing -- is that defendants have their own patents on  
12 monitoring and reporting environmental data as well. So it  
13 obviously benefits them if our patent is found valid as  
14 well.

15 THE COURT: All right. I appreciate the argument  
16 on both sides in this. I'm going to take a little time to  
17 sort of go through the papers. I will give you back the  
18 PowerPoint just to -- to make sure that it was used for  
19 informational purposes -- and it was helpful; so I do  
20 appreciate it.

21 Is there anything else that needs to be addressed  
22 before the Court takes the matter under submission, from  
23 either side?

24 MR. HAWKINS: No, Your Honor. But may I make one  
25 last response? Can't help myself.

1 THE COURT: I will allow it. We still have some  
2 time.

3 MR. HAWKINS: It's very short. And the idea -- I  
4 mean, plaintiffs has laid out what its field is, and it's  
5 geostatistical data and that our system falls outside of  
6 that -- it necessarily allows us for some room for not an  
7 infringement position.

8 And the fact that these are means-plus-function  
9 claims -- the courts have already found -- courts have found  
10 that whether they're means plus function -- in fact, the  
11 Intellectual Ventures versus Manufacturers and Traders Trust  
12 Company says that, just because you use means-plus-function  
13 language in your claim doesn't pull you into patent eligible  
14 subject matter or require that the Court needs to construe  
15 the claims.

16 With that being said, we pointed to corresponding  
17 structure, and it's still generic, general purpose  
18 computers, and that's all I have.

19 THE COURT: Thank you, Counsel. I appreciate the  
20 argument. Clearly, both sides are well prepared. I want to  
21 take some time to think this through. I'm hoping to get an  
22 order out before the end of the week, but it may not happen  
23 but -- so until then, the matter is under submission. All  
24 right. Thank you all.

25 MR. HAWKINS: Thank you, Your Honor.

1 MR. LeFAN: Thank you.

2 MR. NI: Thank you, Your Honor.
